Abstract

The aim of this study was to investigate and compare the chemical composition of essential oils obtained by Clevenger-type apparatus from capitula (TCC) and aerial parts including leaves and stems (TCA) of *Tanacetum cilicicum* (Boiss.) Grierson from Turkey. TCC and TCA essential oils were separately analysed by GC-FID and GC/MS. Forty and thirty-two compounds were identified, representing 99% and 94.4% of the oils of TCC and TCA essential oils, respectively. The main constituents of the oil of the TCC were camphor (28.8%), (*E*)-nerolidol (16.9%), *trans*-chrysanthenyl acetate (12.8%) and 1,8-cineole (8.9%), whereas the oil from TCA comprised mainly *trans*-chrysanthenyl acetate (22.2%), borneol (19.4%), camphor (11.2%), 1,8-cineole (10.2%) and (*E*)-nerolidol (9.2%). The results showed that TCC and TCA essential oils were rich in oxygenated monoterpenes and oxygenated sesquiterpenes. This study is the first to study the essential oil composition of different parts of *Tanacetum cilicicum* separately. Also, to the our best of our knowledge, (*E*)-nerolidol was found in the *Tanacetum* species as the major compound for the first time.

Keywords: Tanacetum cilicicum, essential oil, 1,8-cineole, borneol, camphor, (E)-nerolidol, trans-chrysanthenyl acetate

Introduction

The genus *Tanacetum* comprises forty-six species in Turkey and nineteen of which are endemic (NGBB, 2019). *Tanacetum* species are used in the treatment of abdominal pain, ulcer, lung diseases, colds, shortness of breath, bronchitis, flu, throat diseases, hoarseness, diabetes, scabies, boils, inflammatory skin diseases, itching, kidney stone, rheumatism, migraine, infertility, menstrual disorders and also as carminative, facilitating digestion appetizing, expectorant, wound healing, antipyretic, tonic, anthelmintic. Some *Tanacetum* species have been reported to possess anticancer, antimicrobial, anti-inflammatory and antioxidant activities (Mantle et al., 2000; Rosselli et al., 2012). *Tanacetum* species contain essential oils (Table 1), flavonoids and sesquiterpene lactones as secondary metabolites (Tabanca et al., 2007; Gören et al., 2002; Polatoğlu et al., 2010a).

Previous phytochemical studies reported that *Tanacetum cilicicum*, known as "Kaba pireotu" in Turkey, contained phenolic compounds [*p*-Coumaric acid, ferulic acid, gallic acid, gentisic acid, chlorogenic acid, chrysin, galangin, quercetin, naringenin, catechin] and essential oils [Bicyclo (3,1,1) hept-2-en-4-ol, camphor, 1,8-cineole, 1,6,10-dodecatrien-3-ol, linalool, sesquisabinene hydrate] (Gecibesler et al., 2016; Ulukanli et al., 2017). Also, this species was found to have antioxidant (Gecibesler et al., 2016; Arıtuluk et al., 2016; Yıldırım et al., 2019), anti-inflammatory (Yıldırım et al., 2019), cholinesterase inhibitory (Orhan et al., 2015), antimicrobial (Ulukanli et al., 2017) and phytotoxic (Ulukanli et al., 2017) activities.

Although there are reports on the chemical composition of essential oil obtained from the aerial parts of *Tanacetum cilicicum*, the current study was aimed to investigate comparatively for the first time the

chemical composition of essential oils obtained separately from capitulum and aerial parts excluding capitulum.

Materials and Methods

Plant material

Aerial parts of plant were collected in the flowering period from Pülümür district of Tunceli province of Turkey in 2017 and identified by one of us (AD). Voucher specimens were deposited in the Herbarium of the Faculty of Pharmacy, Marmara University (MARE No: 17768).

Isolation of essential oil

Capitula (100 g) and aerial parts including leaves and stem (200 g) were separately hydrodistilled for 4 hours using a Clevenger apparatus. The essential oils obtained were stored at 4°C in the dark until analysed.

GC and GC-MS conditions

The oils were analysed by Gas Chromatography-Flame Ionization Detector (GC-FID) and Gas Chromatography-Mass Spectrometry (GC/MS) using an Agilent GC-MSD system (Mass Selective Detector-MSD).

GC-MS analysis

The GC-MS analysis was carried out with an Agilent 5975 GC-MSD system (Agilent, USA; SEM Ltd., Istanbul, Turkey). Innowax FSC column (60m x 0.25mm, 0.25 μ m film thickness) was used with helium as carrier gas (0.8 mL/min). GC oven temperature was kept at 60°C for 10 min and programmed to 220°C at a rate of 4°C/min, and kept constant at 220°C for 10 min and then programmed to 240°C at a rate of 1°C/min. Split ratio was adjusted 40:1. The injector temperature was at 250°C. The interphase temperature was at 280°C. MS were taken at 70 eV. Mass range was from *m/z* 35 to 450.

GC-FID analysis

GC-FID analyses were performed using an Agilent 6890N GC system. FID temperature was set to 300°C and the same operational conditions were applied to a triplicate of the same column used in GC–MS analyses. Simultaneous auto injection was done to obtain equivalent retention times. Relative percentages of the separated compounds were calculated from integration of the peak areas in the GC-FID chromatograms.

Identification of compounds

The components of essential oils were identified by comparison of their mass spectra with those in the Baser Library of Essential Oil Constituents, Adams Library (Adams, 2007), MassFinder Library (Hochmuth, 2008), Wiley GC/MS Library (McLafferty & Stauffer, 1989) and confirmed by comparison of their retention indices. These identifications were accomplished by comparison of retention times with authentic samples or by comparison of their relative retention index (RRI) to a series of n-alkanes. Alkanes (C₈-C₂₉) were used

as reference points in the calculation of relative retention indices (RRI) (Curvers et al., 1985). Relative percentage amounts of the separated compounds were calculated from FID chromatograms. The analysis results are expressed as mean percentage \pm standard deviation (SD) (n = 3) as listed in Table 2 and 3.

Results and Discussion

The aim of our study was to comparatively investigate the chemical composition of water-distilled essential oils obtained from capitula (TCC) and aerial parts including leaves and stems (TCA) of *Tanacetum cilicicum* (Boiss.) Grierson from Turkey.

Forty and thirty-two compounds were identified, representing 99% and 94.4% of the oils of TCC and TCA, respectively. The main compounds of the oil of the TCC were identified as camphor (28.8%), (*E*)-nerolidol (16.9%), *trans*-chrysanthenyl acetate (12.8%) and 1,8-cineole (8.9%), whereas *trans*-chrysanthenyl acetate (22.2%), borneol (19.4%), camphor (11.2%), 1,8-cineole (10.2%) and (*E*)-nerolidol (9.2%) were found as major compounds in the essential oil of TCA (Table 2 and 3).

RRI; Relative retention indices calculated against *n*-alkanes C8-C29. %; calculated from the FID chromatograms and expressed as mean \pm SD (*n* = 3). tr; Trace (<0.1 %); t_R, identification based on the retention times (t_R) of genuine compounds on the HP Innowax column; MS, identified on the basis of computer matching of the mass spectra.

The terpenoids consist of the main portion of essential oils and oxygenated monoterpenes (67.7%) were the main group of constituents of TCC oil, followed by oxygenated sesquiterpenes (24.1%), monoterpene hydrocarbons (6.1%), aromatic ester (1%), sesquiterpene hydrocarbons (0.4%), saturated fatty acid (0.2%). The major groups of compounds of TCA oil were oxygenated monoterpenes (73.2%), followed by oxygenated sesquiterpenes (14.7%), monoterpene hydrocarbons (7.3%), sesquiterpene hydrocarbons (0.8%) (Table 2 and 3).

There are only two reports on the composition of essential oil of *Tanacetum cilicicum*. In these studies, the chemical content of the essential oils obtained from the aerial parts containing the capitulum, stem and leaves of the plants was studied. Gecibesler et al. (2016) found bicyclo (3,1,1) hept-2-en-4-ol (21.9%), camphor (15.6%), 1,8-cineole (13.5%), 1,6,10-dodecatrien-3-ol (7.9%) as major compounds in oil, while Ulukanli et al. (2017) reported 1,8-cineole (eucalyptol) (5.1%), linalool (7.0%), sesquisabinene hydrate (6.9%) as major compounds. Contrary to these studies, in our current study, the chemical analysis of the essential oils *T. cilicicum* was performed separately for capitula and aerial parts (stem and leaves). However, similar to previous studies, camphor and 1,8-cineole were found to be major compounds in the essential oils (Gecibesler et al.,2016). The plant materials used in both studies were collected from the same areas. This may explain the similarity of chemical compositions of both oils.

In addition, the major components of *T. cilicicum* essential oils have also been previously reported from other *Tanacetum* species. Briefly, camphor in the essential oils of *T. mucroniferum* (Polatoglu et al., 2012a), *T. tomentellum* (Tabanca et al., 2016), *T. alyssifolium* (Kandemir et al., 2008), *T. argenteum* subsp. *flabellifolium* (Tabanca et al., 2007), *T. chiliophyllum* var. *chiliophyllum* (Polatoğlu et al., 2012b; Başer et al., 2001), *T. densum* subsp. *eginense* (Polatoğlu et al., 2012c), *T. parthenium* (Polatoğlu et al., 2010b), *T. armenum* (Başer et al., 2001), *T. haradjani* (Başer et al., 2001), *T. macrophyllum* (Demirci et al., 2007), *T. argyrophyllum* var. *argyrophyllum* (Polatoğlu et al., 2010c); *trans*-chrysanthenyl acetate in the essential oil of *T. parthenium* (Polatoğlu et al., 2010b); 1,8-cineole in the essential oil of *T. mucroniferum* (Polatoğlu et al., 2010), *T. tabrisianum*

(Polatoğlu et al., 2011b), T. chiliophyllum var. chiliophyllum (Polatoğlu et al., 2012b), T. densum subsp. eginense (Polatoglu et al., 2012c), T. argyrophyllum var. argyrophyllum (Gören et al., 2001), T. praeteritum subsp. praeteritum (Gören et al., 2001), T. argenteum subsp. argenteum (Polatoğlu et al., 2010a), T. densum subsp. amani (Polatoğlu et al., 2010a), T. armenum (Başer et al., 2001), T. haradjani (Başer et al., 2001), T. cadmeum (Gogus et al., 2009), T. cadmeum subsp. orientale (Özek et al., 2007), T. argyrophyllum var. argyrophyllum (Polatoğlu et al., 2010c), T. macrophyllum (Polatoğlu et al., 2015); borneol in the essential oils of T. alyssifolium (Kandemir et al., 2008), T. densum subsp. eginense (Polatoglu et al., 2012c), T. praeteritum subsp. praeteritum (Gören et al., 2001), T. armenum (Başer et al., 2001), T. cadmeum subsp. orientale (Özek et al., 2007), T. argyrophyllum var. argyrophyllum (Polatoğlu et al., 2010c), T. macrophyllum (Polatoğlu et al., 2015) have been found in previous studies. On the other hand, although (E)-nerolidol was found as a minor compound in the essential oil of different Tanacetum species (Ulukanli et al., 2017; Polatoğlu et al., 2012a; Polatoğlu et al., 2012b; Başer et al., 2001; Özek et al., 2007; Demirci et al., 2007; Polatoğlu et al., 2010c; Başer et al., 2001), it was found to be a major compound in the current study. Generally, essential oils of Tanacetum species are characterized by high amounts of monoterpene compounds (Table 1). The essential oil of T. cilicicum in our current study was found to be rich in monoterpene compounds.

Conclusion

The present study showed that essential oils of TCC and TCA were rich in oxygenated monoterpenes and oxygenated sesquiterpenes. Also, the results showed that (*E*)-nerolidol was found, for the first time, as a major compound in the *Tanacetum* oils.
